I opened a Matlab code and this app didn't recognize it. When I choose Matlab manually, the file's highlight changed immediately but then stuck there, forever... Pretty good. So far haven't had any issues with the app. It would be awesome if one could open a file when previewing a searched variable/function that may exist in a different file. Multiple tabs would also be great. Bytecode Viewer - a lightweight user-friendly Java/Android Bytecode Viewer, Decompiler & More. Bytecode Viewer (BCV) is an Advanced Lightweight Java/Android Reverse Engineering Suite. Powered by several open source tools BCV is designed to aid in the reversing process. BCV comes with 6 decompilers, 3 disassemblers, 2 assemblers, 2 APK converters, advanced searching, debugging & more. It's written completely in Java, and it's open sourced. It's currently being maintained and developed by Konloch. Is there a demo? Please note this demo is from a very old version How do I install BCV? Download the latest version from and run the Bytecode-Viewer-2.10.x.jar. You may need to execute it via command line java -jar Bytecode-Viewer-2.10.x.jar (replace the X with the current minor version) How can I use BCV? Starting with a Jar, Zip, ClassFile or Android file (APK, DEX, XAPK, etc) drag it into BCV. It will start the decoding process automatically. From here you can select the decompilers you would like to use by selecting the View Pane>View 1, View 2, View 3, etc. The view panes are-used to display up to 3 decompilers side by side, you can also toggle edibility here. Select the resource you would like to open by navigating using the resource list, BCV will do its best to display it (Decompiling, Disassembling, etc). You can use plugins to help you search along with using the search pane in the left-hand bottom corner. How do the plugins work? There is also a plugin system that will allow you to interact with the loaded classfiles. You could for example write a String deobfuscator, a malicious code searcher, or anything else you can think of. You can either use one of the pre-written plugins, or write your own. The plugin system supports java and javascript scripting. Once a plugin is activated, it will execute the plugin with a ClassNode ArrayList of every single class loaded in BCV, this allows the user to handle it completely using ASM. Instructions to compile just clone this repo and run mvn package. It's that simple! Working on the source Open the Maven project (e.g. in IntelliJ, open the pom.xml as a project file), Java Heap Space Issues (java.lang.OutOfMemoryError) Start BCV with more RAM, e.g. java -Xmx3G -jar BCV.jar File Permission Issues (java.io.FileNotFoundException) Right click on the jar file, go to Properties, and select Unblock under Security at the bottom of the General tab. APK File Permission Issues (java.io.FileNotFoundException) Run BCV as administrator. Are you a Java Reverse Engineer? Do you want to learn? Join The Bytecode Club Today! -
